CASE STUDY: THE USE OF VISCUM ALBUM AND INTRAVENOUS ASCORBIC ACID IN A LYNCH SYNDROME PATIENT WITH RECURRING CANCER

Abstract:

Lynch syndrome is the most frequent hereditary cancer syndrome accounting for 3-5 percent of all colon cancer cases\(^1\). It is also the most frequent predisposing inherited cause of endometrial cancer and is associated with ovarian, urogenital and gastric cancers\(^1\). This is a genetic condition caused by mutations in one of several DNA mismatch repair (MMR) genes responsible for correcting DNA damage\(^2\). In this case report we examine the use of intravenous ascorbic acid (IVAA) and *Viscum album* in a female patient diagnosed Lynch syndrome at Integrated Health Clinic. The patient had a prior history of colorectal and endometrial cancer, who due to side effects was unable to continue with her standard of care treatments.

Case history

This is a case of JF, a 40 year-old female who came in on July 2010 seeking adjuvant naturopathic cancer treatments. She had a previous diagnosis of Lynch syndrome and had a long personal history of colorectal cancer with concurrent invasion of the left fallopian tube in 2004. At that time she underwent a partial colectomy and left salphingo-oopherectomy, with no adjuvant treatment being recommended. A hysterectomy and right salphingo-oophorectomy was then performed in June 2010 due to the presence of a large 525 gram uterine mass. Pathology of the uterine mass was reported as a grade 2 endometrial adenocarcinoma of the right ovary and uterine corpus. Adjuvant chemotherapy consisting of Carboplatin and Taxol was initiated. JF finished 1 cycle and experienced profound side-effects including fatigue, numbness and tingling of extremities therefore unable to continue with any further treatment. As with all our patients, JF was advised to continue care with her medical oncologist throughout her care.

Lynch syndrome is carried on her father's side, with both a paternal uncle and aunt having been diagnosed with colorectal cancer, and another aunt with uterine cancer. Her father was later diagnosed with prostate cancer in 2012. There is no presence of cancer on her maternal side. JF began naturopathic treatments in August 2010 consisting of 50 grams IVAA and mistletoe lectins (Iscador) three times weekly. Prescription and targeted supplementation was also provided (Table 1, 2).
### Table 1. Prescribed Targeted Supplementation

Induce apoptosis and inhibit angiogenesis of tumor cells\textsuperscript{17}. Thermal sensitizer and prevents thermotolerance\textsuperscript{18}

| Cimetidine | 400mg p.o. BID | Anti-adhesion and antiangiogenesis. Inhibit tumor cell propagation and metastasis\textsuperscript{19}. Repurposed as an anti-cancer agent\textsuperscript{20} |

| **Supplements** | | |
| Can-Arrest Boswellia | Boswellia 200mg Curcumin 200mg Quercetin 100mg 2 capsules p.o. BID | Inhibition of the transcription factor NF-κB to arrest tumor growth and progression\textsuperscript{21}. Anti-inflammatory and antioxidant activity causing inhibition of vascular endothelial growth factor-mediated angiogenesis in human intestinal microvascular endothelial cells\textsuperscript{22} |
| Avemar | 1 sachet p.o. QID | Anti-tumoral. Immune modulation. Improve quality of life\textsuperscript{23}. Induced apoptosis and exert significant antitumor activity\textsuperscript{24} |
| Pectasol-C | 3 scoops p.o. QID | Bind to galectins on cancer cell surface interfering with cancer cell metastatic target site interaction\textsuperscript{25}. Immunostimulatory. Activation of functional T-cytotoxic cells, B-cell and NK cells\textsuperscript{26} |
| Fish oil | 1-2 tablespoon p.o. QID | Inhibit acute phase protein response and cachexia\textsuperscript{27}. Prevent progression of APPR and cachexia in |
| Weight Losing Patients with Advanced Cancer<br>\hline Melatonin | 20mg p.o. QHS | Immunomodulatory. Augment production of T-lymphocytes and NK cells. Oncostatic properties in melanomas and tumors of epithelial origin\(^{29}\). |

One month following, a CT scan showed significant interval improvement from a previous CT prior to hysterectomy. Residual disease was noted with the presence of 2.3 x 1.9 cm lesion between the posterior aspect of the bladder and rectum. A pelvic ultrasound in October 2011 found a hypoechoic structure measuring 1.5 x 1.3 cm adjacent to the right pelvic sidewall. (Fig 1)

**Figure 1. - abdominal ultrasound - October 25, 2011**

JF continued to have regular follow up at IHC, she was asymptomatic and had no expected cancer-related systemic, abdominal or pelvic complaints. She had continued to follow all prescribed dietary and supplementary recommendations. IVAA was reduced beginning in October 2011 to twice weekly. A follow up abdominal ultrasound in January 2012 reported no remnants of the structure and the rest of the scan was clear (Figure 2).
JF continued her naturopathic treatments, which she tolerated well and without side effects. She takes her supplements regularly and continues with her twice-weekly Iscador injections. She is now on a maintenance dose of IVAA 50 grams bimonthly, and she remains in a complete remission, with no evidence of disease. CA-125 results have shown a continually slowly declining trend, and the CEA tumor marker results remain generally stable, and within normal limits (Figure 3).

**Figure 3. – CA 125 and CEA**

**Discussion**

The overall lifetime risk of developing cancer is approximately 54% in patients who carry defective MMR genes. The risk of developing colorectal and uterine cancer is also staggeringly high at approximately 52% and 65% respectively depending on which DNA alleles are involved. Five-year survival rates in affected family
members when treated are on average better than sporadic cancers. Reasons for improved survival are not known but it is speculated that the biology and fundamental nature of the cancer may be different. IVAA as an adjuvant cancer therapy, has demonstrated anti-tumour and chemosensitization effects as well as overall improvement in quality of life. At serum milli-molar concentrations, ascorbic acid generates hydrogen peroxide, a cytotoxic reactive oxygen species. In healthy cells hydrogen peroxide is catabolized to water and oxygen via catalase. Tumour cells lack catalase enzymes leaving malignant cells vulnerable to the cytotoxic effects of hydrogen peroxide. Tumour cells also take up more vitamin C than do healthy cells through the upregulation of glucose transports as a means to adapt to increased metabolic demand. IVAA has also shown to reduce angiogenesis and inflammation through the suppression of COX-2 and NFκB. *Viscum album* (mistletoe) is a plant that grows on the branches of a variety deciduous and coniferous trees. The stems and leaves contain biologically active agents including mistletoe lectins, visco toxins, flavonoids, and polysaccharides known to have immunomodulating and cytotoxic effects. Most research has focused on mistletoe lectins (ML) as these substances inhibit protein synthesis and induce apoptosis in cancer cells. Studied in vitro and vivo, ML induces an immune cascade increasing concentrations of various cytokines (interleukin-5, interleukin 12, interferon gamma and TNF-α) and immune cells including natural killer cells, neutrophils, and lymphocytes. Taken together, investigations have led to the belief that mistletoe up-regulate immunologic responses leading improved immunosurveillance and tumour killing. Human studies examining the application of mistletoe in uterine cancers are limited. In vitro and vivo studies have either shown no response or cytotoxic effects and growth inhibition when uterine cell lines are exposed to mistletoe extracts. Human research has documented improved overall survival rates with the use of mistletoe in conjunction with conventional cancer treatment when compared to cohorts using standard medical therapies alone. Furthermore, significant improvements in psychological well-being and quality of life have been noted with the use of mistletoe in uterine cancers. Reported side effects were minimal with local allergic reaction at the injection site and fever being most common. This case report examines the use of alternative treatments including IVAA and mistletoe extracts as either an adjunct to conventional cancer therapies or used alone if patients are unable to tolerate side effects of mainstream oncologic treatments. The particular patient, who could not continue with chemotherapy due to side-effects shows positive responses to ongoing use of IVAA and mistletoe lectins with no apparent side effects.

**Conclusion:**

This case report shows that naturopathic integrative oncology treatment is safe and apparently effective for the management of Lynch syndrome with recurring carcinoma. In this case, naturopathic treatments have been better tolerated than standard of care, and without any reported side effects. The use of *Viscum album* and
intravenous ascorbic acid, alongside targeted supplementation and the use of repurposed drugs, played an important role in the patient’s wellness and quality of life.
